Here are some choices and ideas about the design of my line graph.

- I selected an appropriate data set.
- Colors are category10(), which means the lines are colored with pre-fixed colors in alphabetical order. Which is ok for me. As long as the colors are clearly distinguishable, which they are.
- I made a legend, but labels at the end of the line are more clear I think. So I went with that. I made the legend because I was afraid that in other datasets the lines would join at the end. Thus making the labels overlap. This is however very improbable with this sort of data (minimum/maximum temp during a day). I thought of this quite late :(
- The plot has a title, axes are labeled, quantities have a unit.
- Changing the city lets the graphs transition very smooth into each other. I like that :)
